

## **1990 BAY CLAM DATA SERIES REPORT**

### **INTRODUCTION**

This report summarizes the results of our bay clam studies in 1990. Activities summarized include recreational and commercial clam fishery monitoring, hatchery stock enhancement, and natural recruitment studies. This report is presented as a series of tables and figures with a minimum of discussion; other reports will evaluate the data presented here. The tables and figures included give a historical overview of clam harvesting activities and are presented in a manner to allow future analysis to show trends or changes in stock status and fishing activities. This report is intended primarily to be an internal document, to be used as a reference by the shellfish staff.

### **RECREATIONAL CLAM FISHERY**

Recreational clam digger interviews are conducted annually on each of the major clam harvesting tideflats of the Tillamook, Netarts, Nestucca, Yaquina, Alsea, Siuslaw, and Coos estuaries. Interviews are usually conducted by two shellfish staff members. A count of diggers is made on each tideflat at low tide; this provides a peak digger count for that day. Currently, an effort is made to visit each tideflat at least two times per season, in the spring and again in midsummer. This is about half of the sampling effort that we expended annually from 1975 to 1984 to collect recreational use data.

We attempt to measure a minimum of 200 clams of each species for each tideflat. In 1988, we discontinued aging the clams we measured. We measure the height of the cockle clam and the length of the butter, gaper, littleneck, and softshell clams.

Interview data collected included catch/effort, digger origin, species, and length composition. These data are presented for each tideflat in Appendix Tables 1-21. Table 22 summarizes the recreational activities presented in Tables 1-21 and Table 23 shows the peak counts of clam diggers taken at low tide for each of the surveyed tideflats.

In 1990, we interviewed 1,363 clam diggers that expended 2,029 hours of effort to harvest 22,847 clams (Table 22). The clam diggers averaged 16.8 clams/trip or 11.3 clams/hour. Digging success was slightly poorer in 1990 than in 1989 when 17.2 clams/trip were taken. Since 1977, when the

Commission approved a reduction in bag limit from 36 to 20, clam digger harvest has ranged between 14.7 and 18.8 clams/trip. In 1976, prior to the reduced bag limit, clam diggers averaged 20.9 clams/trip.

As in previous years, most clam diggers traveled some distance to harvest clams. In 1990, 31.3% of the diggers were local county residents, 62.7% were from Oregon but living outside the county of harvest, and 5.9% were out-of-state residents (Table 22). These figures were generally the same as in 1989.

The cockle clam was the most frequently observed species in the recreational fishery representing 30.4% of the 1990 harvest (Table 22). Gaper, butter ,softshell, and littleneck clams comprised 23.6, 22.7, 12.4, and 8.7% of the bag, respectively. Somewhat surprising, and encouraging, was the increased incidence of gaper clams in the harvest, especially from clam beds in Netarts and Coos bays. This indicates recent recruitment for this species is starting to have an impact on clam harvesters digging success.

Data collected on length composition since 1979 revealed only minor variations in overall mean size for each species (Figure 1). Gaper, softshell, butter, cockle, and littleneck clams averaged 113.7, 89.6, 78.5, 61.4, and 53.4 mm in 1990, respectively.

Changes in digging effort through time as reflected by peak digger counts revealed digging effort generally similar to 1989 for most of the surveyed tideflats (Table 23). Most of the clam beds in Coos Bay experienced a slightly higher digging pressure than in 1989.

### **COMMERCIAL CLAM HARVEST**

In 1990, we issued 92 permits to commercial fishermen to harvest bay clams (Table 24). Of this total, 38 reported landing 72,756 lb of clams. In 1989, 24 clam diggers reported landing 60,482 lb of clams. Of the total clams landed in 1990, 45,607 lb (62.7%) were cockles (Table 25). Tillamook Bay was the major producer with 44,043 lb (96.6%) of the total cockle harvest. Other clams harvested coastwide were gapers (10,391 lb), littlenecks (7,521 lb), softshells (4,633 lb), and butters (4,604 lb). Although the commercial harvest of gaper clams nearly doubled in 1990 over the previous year, the general decline in harvest since 1982, when 106,440 lb were taken, again illustrates poor recruitment of this species in several of our bays.

Tillamook Bay produced the most clams in 1990 with 47,198 lb reported (Table 26); Coos Bay produced 14,363 lb. Nehalem, Yaquina, Alsea, and Umpqua bays produced minor poundages of clams.

## **SPECIAL STUDIES**

### **Hatchery Stock Enhancement**

#### **Tillamook Bay**

No Manila clams were planted in Tillamook Bay in 1990. In addition, we did not sample the Manila clams planted in previous years.

#### **Yaquina Bay**

Two Manila littleneck clam test plots were sampled in Yaquina Bay in 1990 (Table 27). Manila clams in both plots were protected by Vexar netting. Clams planted in 1985, averaging 18.1 mm in size, averaged 53.8 mm when sampled. Over 18% of the originally released clams survived. Clams planted in 1986, averaging 6.7 mm in size, averaged 50.6 mm when sampled. Survival rates were not calculated for this group of clams.

#### **Coos Bay**

Six Manila littleneck clam test plots were sampled in Coos Bay in 1990. Table 28 shows the results of our Manila littleneck clam plants in Coos Bay since 1973. Unfortunately, test plot nos. 4, 5, 6, and 8 were destroyed by clam diggers precluding our estimating survival rates for clams in these areas.

## **Natural Recruitment Studies**

#### **Yaquina Bay**

We collected 20 subtidal dredge samples from an 18.4 acre area in Yaquina Bay in September 1990 to determine year-class strength, recruitment success, and population and biomass estimates (Figure 2). Each sample covered 1 sq ft of surface area; depth of samples averaged 12-14 inches.

The 20 samples produced 154 gaper clams (7.7/sq ft) that averaged 94.1 mm in size. As in 1988, we observed some evidence of recruitment; 24.6% of the sampled clams were of the 1990 year class (Figure 3). The 1990 year- class clams averaged 1.9 gapers/sq ft; average size was 8.9 mm. The

1975 year-class continued to dominate the standing crop comprising 73.4% of the 1990 sample. We estimated that 6.2 million gapers, weighing 8.0 million lb, inhabited the area (Table 29).

### **Netarts Bay**

In addition to the subtidal samples taken in Yaquina Bay, we collected ten 1 sq ft intertidal samples in Netarts Bay to determine gaper clam recruitment success . The samples were collected from the intertidal clam bed at Happy Camp and washed through a 3 mm screen. Results revealed that recruitment continued to be extremely poor with only 0.5 clams/sq ft, averaging 5.7 mm in size (Figure 3). In 1989, the same area also produced 0.5 new recruits/sq ft. None of the 1989 year-class clams were recovered in 1990.

### **ACKNOWLEDGMENTS**

I wish to thank Darrell Demory, Bob Hannah, Terry Link, Jean McCrae, Steve Jones, and Neil Richmond, for their assistance in gathering the data that was used in this report.
