FOREWORD

The statistics presented in this publication provide information on the amount and value of commercial food fish landings in the State of Oregon in 1979. This information is frequently requested by various government, industry, or private user groups for resource management, marketing, land use planning, or other needs. We have not attempted to explain management objectives, harvest methods, or trends in the commercial fisheries.

The joint efforts of many persons were required to assemble this material-- the commercial fishing industry, wholesale fish dealers, and Oregon Department of Fish and Wildlife personnel. Department biologists reviewed the accuracy of the reported information and data processing personnel spent many hours editing and entering the information for computer tabulation. To all of these people we extend our thanks.

EXPLANATION OF TABLES

Source of data

Oregon law requires commercial fishermen to sell their catch to a licensed wholesale fish or bait dealer. At time of sale, the dealer must record certain information on a Fish Receiving Ticket form supplied by the Department. This information includes date of landing, unloading station, gear used to take the fish or shellfish, pounds landed by species, and price per pound paid to the fisherman. The fish tickets are returned to the Department where they are edited for accuracy and completeness prior to processing for tabulation.

Landings

Commercial landings are reported for the Columbia River (Oregon landings only) and locations along the coast (Fig. 1). Coastal locations represent the major port or area of landing. These landings include ocean, bay or inland caught fish or shellfish. For ocean caught fish, port of landing does not necessarily indicate the area of catch as many boats fish coast-wide and return to their home port to land their catch. Bluefin, yellowfin, and skipjack tuna are generally caught off the coast of South America but are landed in Oregon for processing.

The common and scientific names of species reported in the commercial catch are shown in Table 1. Fishdealers are required to record each species landed; however, this is not always possible due to the difficulty in identifying certain species. The numerous rockfish species are recorded collectively as "rockfish." Pacific ocean perch landings also include several species of rockfish that are perch-like in appearance. Prior to 1978 both arrowtooth flounder and curlfin sole (turbot) were reported as "turbot" due to local name differences along the coast--all "turbot" landings were considered to be arrowtooth flounder since curlfin sole comprise only a minor portion of the total catch. This problem was resolved in 1978, and both species are now reported correctly.

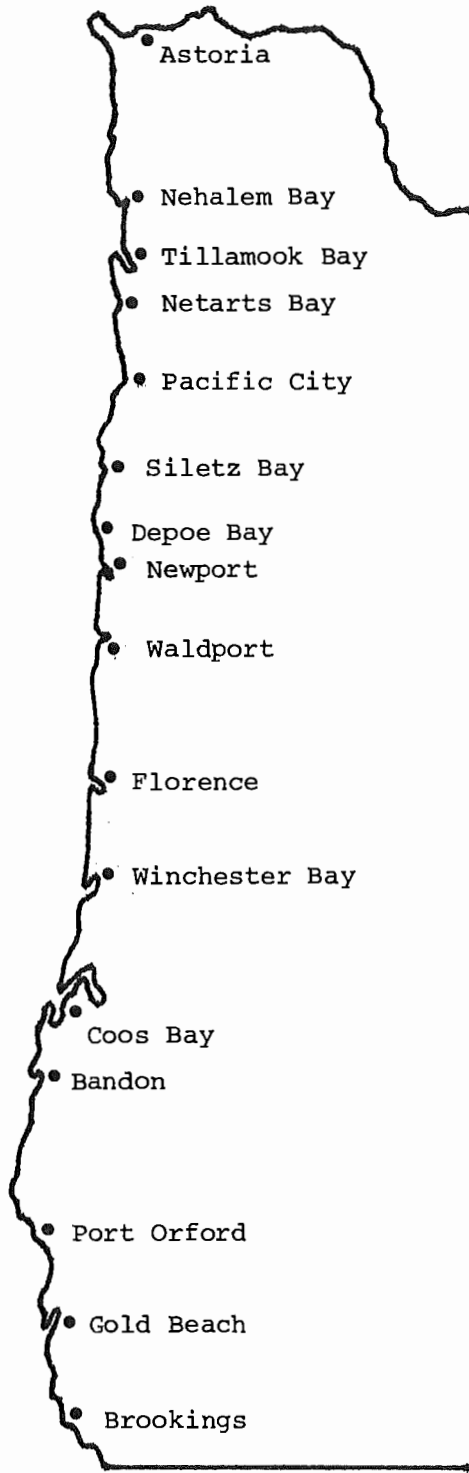

Figure 1. Oregon coastal ports.

All fish and shellfish landings, unless otherwise indicated, are reported as round (whole) weight. Certain species may be dressed or filleted prior to landing and the following percentages were used to convert these landings to pounds round weight:

| | |
|----------------------------|--------|
| Salmon, troll dressed..... | + 15% |
| Sablefish, dressed..... | + 60% |
| Halibut, dressed..... | + 15% |
| head-off..... | + 35% |
| Hake, filleted..... | + 235% |

Landings by month reflect the date of purchase by a dealer. This may not necessarily be the date the fish were caught, as many vessels have the capability of holding fish for extended periods of time before returning to port. Further, fishermen are not required to sell their catch immediately upon landing, and they may store their catch in cold storage until prices improve or for whatever other reason they may have.

The trends portrayed in Table 3 (Annual Landings, 1970-79) are the result of many factors such as abundance of fish, market demand, technical advances, and regulations. Most fisheries reflect the effect of all these factors and caution should be used in interpreting or projecting trends.

Value of catch

Estimates of value are determined from price per pound information obtained from fish tickets and indicate the value of the catch to the fishermen. Where this information is not provided, value is determined by using the best alternative estimate of average price per pound; e.g., from nearby ports during the same time period. Due to computer rounding error, values may vary somewhat, but no significant effect on total value is expected.

Table 1. Common and scientific names of species reported in the Oregon commercial catch.

| Common Name | Scientific Name | Common Name | Scientific Name |
|-----------------------------|--|---------------------------|--|
| FISHES | | FISHES | |

1/ Chinook, coho and pink salmon are landed at ocean ports in dressed form. Conversion to pounds round weight was made by multiplying dressed weight by a factor of 1.15.

2/ Includes 3,106,607 pounds albacore, 5,713,979 pounds of other tuna species.

3/ Oyster harvest is reported in gallons and converted to pounds by multiplying by a factor of 8.0.

4/ Miscellaneous includes landings of crayfish, sand shrimp, brine shrimp, herring, mackerel, lamprey, octopus, anchovies, mussels, surf perch, walleye, and scallops.
