UMPQUA RIVER BASIN

Master Plan for Angler Access

and

Associated Recreation Uses

This report details a plan that we hope can be followed to solve the access problems of the Umpqua River Basin. Too, we hope that all agencies that are interested in retaining existing water access as well as providing additional facilities, whether they be municipal, county, or state, will all join in a cooperative effort to carry out this plan in an orderly manner. It is probable that Land and Water Conservation Funds will be available on a 50-50 matching basis. In order to acquire these funds, it will be necessary to apply through the Oregon State Highway Department.

Overall angler access in the Umpqua River Basin is in need of updating and improvement to assure future access where it is now subject to closure on private land and to open up long stretches of the river where no access is available. Most angler pressure in this system is confined to popular holes which are sometimes several miles apart. These holes are often overcrowded with anglers while the river between is untouched. The bedrock nature of the streambed contributes to this crowding tendency, but lack of adequate access (especially boat access) compounds the problem.

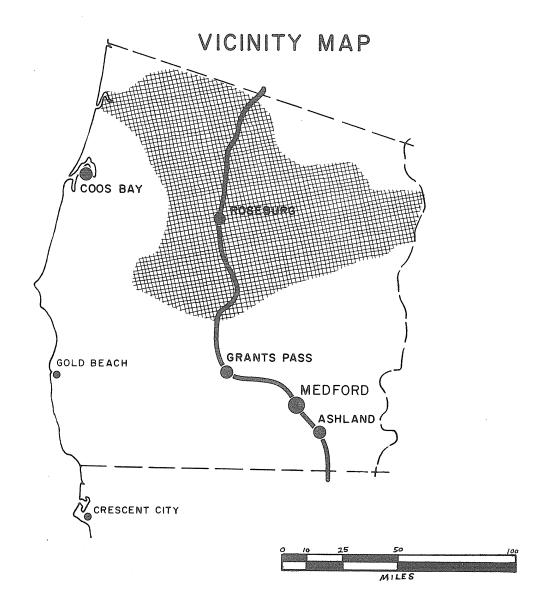

Government timber lands with accompanying parks and camp sites border a sizable portion of the tributary and headwater system of this basin. In these areas angling access is considered to be presently adequate and consistent with other recreational opportunities available.

Sport angling is enjoyed in the Umpqua Basin on a year-round basis. Catch figures in the system from 1961 through 1965 indicate an average annual harvest in excess of 10,680 salmon and 6,100 steelhead. In addition, sea-run cutthroat, trout, shad, sturgeon, striped bass and bullhead catfish all contribute to the Umpqua fishery in varying degrees.

A program of stocking hatchery-reared young sea-run cutthroat, steel-head, salmon and ready-to-catch rainbow trout help sustain the natural stocks in the river and substantially increase the number of fish available to anglers.

Seventy-five sites are included in this access plan for the Umpqua Basin. Included are 12 sites that are considered fully developed at this time and 13 sites that provide some degree of access now, but need additional development to become adequate. Fifty sites within the basin are recommended for acquisition and development to provide water access for anglers and associated recreational users of the present and the near future.

The basin has been divided into four areas according to access needs, and geographical location. Descriptions of these areas and their specific access needs follow in the appropriate sections.

The Umpqua heads in the Cascade Mountains near Diamond Lake and flows west-ward through the Coast Range to the Pacific Ocean at Reedsport.

The river system splits into a north and south fork near Roseburg and includes Smith River (joining at Gardiner) and Little River (joining at Glide). Cow Creek which is another major tributary joins the South Umpqua near Riddle.

Major motor access routes to the lower river include Highway 101, 38 and 138. In the Roseburg area, Interstate 5 bridges both the North and South Umpqua Rivers. Highway 138 follows the North Umpqua to Diamond Lake, while Highway 227 parallels the South Umpqua from Canyonville to Tiller.

SMITH RIVER AREA

This area includes the entire Smith River system with proposed access points confined to the lower 37 miles of the main stem. The side tributaries and upper waters of this system decline in relative importance as a fishery with existing roads and public timber lands providing adequate access.

The river is typical of streams heading in and flowing through the coastal range. Low timbered mountains dominate the upstream sections while dense brush and cut-over timber lands mark the lower reaches. Tidewater effect extends up to Spencer Creek at river mile 23 and turns the river into a flat, slow-moving body of water. Above this point long pools are interrupted by moderate rapids. The area under consideration is boatable with the exception of Smith River Falls located at river mile 29.

Developed angler access is presently limited to a single boat ramp at river mile 8 and two small parks above Smith River Falls which provide some bank angling. The most popular angling water is a 13-mile section located roughly between the mouth of the north fork and Smith River Falls. Proper development of this section would provide access for the bulk of the angler pressure at this time.

The sport fishery on this system includes striped bass, sea-run cutthroat, fall salmon and winter steelhead. The bass, cutthroat, and salmon are taken by a relatively light fishery from boats and the bank in the tidewater sections. Trolling is a popular method of angling for the cutthroat and salmon. In the upper tidewater section and through Smith River Falls, winter steelhead are the main attraction with moderate to heavy pressure developing at a few sites where access is enjoyed on private land. Trout angling is scattered throughout the system and is very light.

Shad are taken in good numbers by commercial means, but have not attracted sport anglers to any degree at present.

Thirteen access sites have been outlined for this area in the following pages with one site considered adequate for angler needs at this time.

REMARKS

This site is a strip of river bank 120 feet wide between the county road and the river. It is covered with sand and drift material from high water.

About five cars can park along the road shoulder and this is considered adequate.

REMARKS

Considerable clearing will be needed to provide parking and a ramp. The area has potential for a picnic site near the ramp.

MAIN STEM UMPQUA RIVER

This section includes 103 miles of the Umpqua River from Gardiner upstream to the forks. The river is of moderate gradient with long pools and rocky rapids flowing through the timbered slopes of the coastal mountains. Narrow valleys occasionally open into flood plain and bench-type grazing lands. In the lower river, tide effect changes the river into a wide, slow moving body of water up to river mile 28 at Scottsburg. The entire section above Scottsburg to the forks is boatable during most flow stages for those boat handlers with rough water experience. During low summer flows a few scattered rapids of particularly rough character become impassable to most boats.

The mouth of the river and the bay area below Gardiner with its special access needs is covered in a separate report on beaches and estuaries of the upper south coast by this agency.

Winter steelhead and spring salmon draw the heaviest angling pressure on the main stem Umpqua. These fisheries occupy most of the winter and spring months and are pursued by both boat and bank anglers. In the tide-water area good numbers of boat anglers fish for striped bass, and sturgeon most of the year. Tidewater areas are also popular for trolling on sea-run cutthroat and fall salmon. In the sections above tidewater sea-run cutthroat, summer steelhead and fall salmon attract light angler pressure at a few popular holes. A rather short and localized shad fishery has enjoyed recent popularity near Yellow Creek (mile 139) and at Leatherwood Rapids (mile 104). While the various fisheries attract increased angler activity on a seasonal basis, the river does provide angling opportunity on a year-round basis.

Most of the main stem Umpqua is accessible from public roads, but extensive private ownership of frontage requires the angling public to rely mainly on access over private lands. Of ten private and public boat ramps established on the main stem, two are located in the forks area and six are located from Scottsburg at river mile 28 downstream through Gardiner. This leaves roughly 80 miles of stream served by the two remaining ramps and is the area of primary need for both boat and bank access.

A total of 33 access sites have been evaluated in the following section with seven considered complete and adequate. Development of the remaining 26 sites will entail acquisition of river frontage and space for parking in most cases. Development of 10 new boat ramps is recommended to distribute angling pressure and provide convenient one-day trips for drift boat angling.

The following site evaluations describe specific access needs.

Safety Problems:

A railroad spur line crosses at head of ramp. No signal device.

Group Facilities:

REMARKS

This ramp receives quite heavy pressure during the winter sturgeon fishery and serves a six-mile section of the bay. Better parking facilities are desirable if and when available.

REMARKS

A flat bench of five acres overlooks the river and has good park potential. The road to the river cuts down a long steep bank to the water and could, in the future, be developed into a boat ramp. Parking is limited to the upper bench.

Group Facilities: Picnicking and bus parking

Oregon Department of Fish & Wildlife

REMARKS This park, bank access and ramp were developed jointly by Douglas County and the State Game Commission.

Popular swimming and boating area during the summer months.

NORTH UMPQUA AREA

Access needs on the North Umpqua River are confined to the lower portion of the stream from the forks up to river mile 32 near the community of Glide. The upper river and side tributaries are adequately served by good roads and public lands.

Topographically the area under consideration is made up of high rolling hills which often break sharply into the riverbed. The river itself is of moderately steep gradient with many bedrock chutes and rocky rapids.

The North Umpqua River has a heavy fishery on winter steelhead and spring chinook where anglers can find access. Stocked trout are popular during the early part of trout season with summer steelhead gaining primary attention from July through September. Sea-run cutthroat and fall salmon are available in the fall but receive lighter pressure as other recreation interests such as hunting attract sportsmen in the area.

Existing public access for anglers is provided at the forks, the area west of Winchester, and at Whistlers Bend Park. The two boat ramps in the Winchester area receive heavy pressure from anglers using the three and one-half mile stretch of river available. A very rough rapids at river mile one and the Winchester dam effectively confine boat traffic to the area between the two ramps. A change of angling regulations to allow boat angling from Winchester Reservoir up to the mouth of Little River has created substantial demand for boat launching access on 21 miles of the North Umpqua River.

Terrain, road access and private ownership severely limit angler access in this 21-mile stretch at the present. The entire section is boatable during winter and spring flows by experienced boat handlers, but during low summer flows bedrock and boulders block passage.

A ramp is currently under construction at the Whistlers Bend county park, and two additional sites are being considered for acquisition at either end of this large section by the State Game Commission. Potentially the boating limit may be extended upstream another three miles and an additional ramp to facilitate anglers in this area would be desirable as recommended at Lone Rock Bridge above Glide.

Altogether nine access sites have been evaluated on the North Umpqua River. Seven of these sites need either initial development or further improvement to adequately provide angler access on the river.

Safety Problems:

Group Facilities:

REMARKS This site is presently located in a portion of the North Umpqua River closed to boat angling. However, a potential boating deadline is located about one mile upstream. This site provides the best point for boat access below the potential boat angling deadline.

SOUTH UMPQUA AREA

The access plan in this section covers 81 miles of the main stem South Umpqua River from the forks upstream to the mouth of Jackson Creek. The balance of the upper river and tributary system is adequately served by existing access on public roads and lands.

The topographic character of the river between Days Creek (river mile 58) and Jackson Creek is marked by timbered slopes and intermittent pasture land. The river gradient is moderate to steep in places with rocky rapids and deep pools. Downstream the gradient decreases and the valleys become wider. The entire area is boatable at higher flows, but requires experience to negotiate the rocky chutes and white water rapids. During summer flows boating is confined to the pool areas.

Winter steelhead and stocked trout provide the main attraction in the South Umpqua River. Steelhead are available from November through February while legal trout are stocked at popular holes from late May through early July. Shad and fall salmon are available in the lower portions of the South Umpqua, but receive only light angler pressure. The larger tributaries to this system receive light trout angling from local anglers while stocked trout attract good numbers of anglers nearly the full length of the main river.

River access on the South Umpqua is spotty and confined primarily to bank angling. Some individuals launch boats over gravel bars, but the only developed ramp is located at the forks. A good portion of the present bank angling is located on private land and is, therefore, subject to closure at the owner's discretion. Twenty access points have been outlined with four of these considered to be of vital need at the present. However, this could change dramatically in a few seasons if contemplated reservoirs are constructed

on this system and improved flows provided for fish life. Substantial increases in runs of salmon and steelhead are possible if suitable water conditions can be gained.

The access points of immediate concern are sites that will improve the harvesting of winter steelhead in the Roseburg and Canyonville areas. The few boat anglers that have gained access to these locations enjoy excellent catch success. Boat access sites located in the Roseburg area can be expected to serve other associated recreational uses as outlined in the Roseburg Comprehensive Urban Development Plan.
