

## **Water Quality Improvement Through Storage of Water**

Council members who expressed concern about erosion, turbidity, and sediment deposition also suggested that new or enlarged existing storage facilities might be used to improve water quality by reducing instream sediment and augmenting late summer stream flows, as well as provide an economic benefit if stored water were used for irrigation.

There is no information currently available on the rate of sedimentation in existing reservoirs to determine sediment reduction benefits that may be provided by these facilities or new facilities. If desired, sedimentation studies in other areas of the West can be evaluated. The sediment entrapment objective for larger reservoirs in the watershed is to "minimize" sedimentation to "minimize" impacts to the water rights for the reservoirs. It is very expensive to remove sediment from reservoirs or to increase dam height to compensate for capacity loss due to sedimentation.

There may be some sites in the watershed where small reservoirs could be used to help with the recovery of gullied stream systems by rebuilding floodplains, especially on the south side of the watershed. However, hydrologists, soil scientists, and riparian ecologists usually recommend that sediment be allowed to pass through stream systems because this is a natural function of streams, because reservoirs that do fill with sediment have long-term dam maintenance needs, and because fresh sediment deposits are needed to rebuild damaged stream channels and floodplains. It is usually much more cost effective to naturally store sediment in stream channels and floodplains, and much more sediment can be stored in floodplains than in reservoirs over the long term. Reservoirs also cause erosion problems. They deplete a stream of sediment and cause the stream reach below the dam to rob sediment from the stream channel, bars and banks that once reduced stream energy, as has occurred below Hells Canyon Dam from the dam to the Salmon River.

Further development of this topic would be more appropriate as part of the Pine Creek Action Plan.

## **Other Pine Creek Watershed Health Considerations**

### **Effects of Elk Population Increase**

Some residents of Pine Valley are concerned about the effects elk are having on watershed health as the elk population increases. Elk grazing is unregulated, in contrast with cattle grazing on the same ranges. They browse on small trees. An adult elk eats nearly as much as an adult cow. Elk are known to visit and create wallows in boggy areas, and create well-defined trails and stream crossings in high use areas that sometimes can deliver sediment to streams. Elk can also spread certain noxious weeds if they graze through those areas. No data was available for comparison of watershed damage caused by cattle versus elk.

### **Effects of Recreation Use Increase**

Some residents of Pine Valley are concerned about the effects of increases in dispersed and developed recreation on watershed health. Dust and sedimentation from roads and trails increases

with increased recreation visitor use. It is common knowledge that trails (especially where motorized vehicles are allowed) and roads become rutted with increased use, especially when used during wet periods. Many roads are rutted annually during the fall hunting period. Stream bank erosion and erosion of road surfaces occurs at stream crossing sites without culverts. Soils are compacted in dispersed and developed campsites. Stream banks, riparian areas, and trees are damaged by trampling, compaction, and chopping in high use areas. Noxious weeds are spread by vehicles, people, and pets from roads and other high use areas to other sites. People leave garbage, trash, and human waste in higher use areas and along roads.<sup>4</sup>

### **Vision Statement and Powder Basin Watershed Council Health Concerns**

## **Vision Statement**

*Vision: We recognize that our local prosperity is dependent upon the current and future availability and quality of our waters. We are committed to ensure that we retain, restore and enhance the health of our watersheds.*

## **Powder Basin Watershed Council Health Concerns**

### **Category A: Legally Mandated and Straight Forward Issues**

- Oregon Department of Environmental Quality (ODEQ) 303 (d) List of Water Quality Impaired Streams
  - assessment of listed stream segments
  - consideration of related politics
  - address the issue of ODEQ temperature standards as well as other questionable standards
  - loss of riparian ecosystems
  - stream channel stability
- Fish Screens
- Noxious Weed Invasions
- Bull Trout Recovery

### **Category B: Legally Mandated and Controversial**

- Baker City Watershed
  - maintenance of water quality to avoid filtration requirements
- Over-Appropriation of Water
  - i.e. water diversions (compliance with the limitation of water rights---delivery system that efficiently delivers the needed water with minimal waste or "Measured Deliveries")
- Improper Water Use (Illegal water use)

### **Category C: Other Concerns Not Legally Mandated**

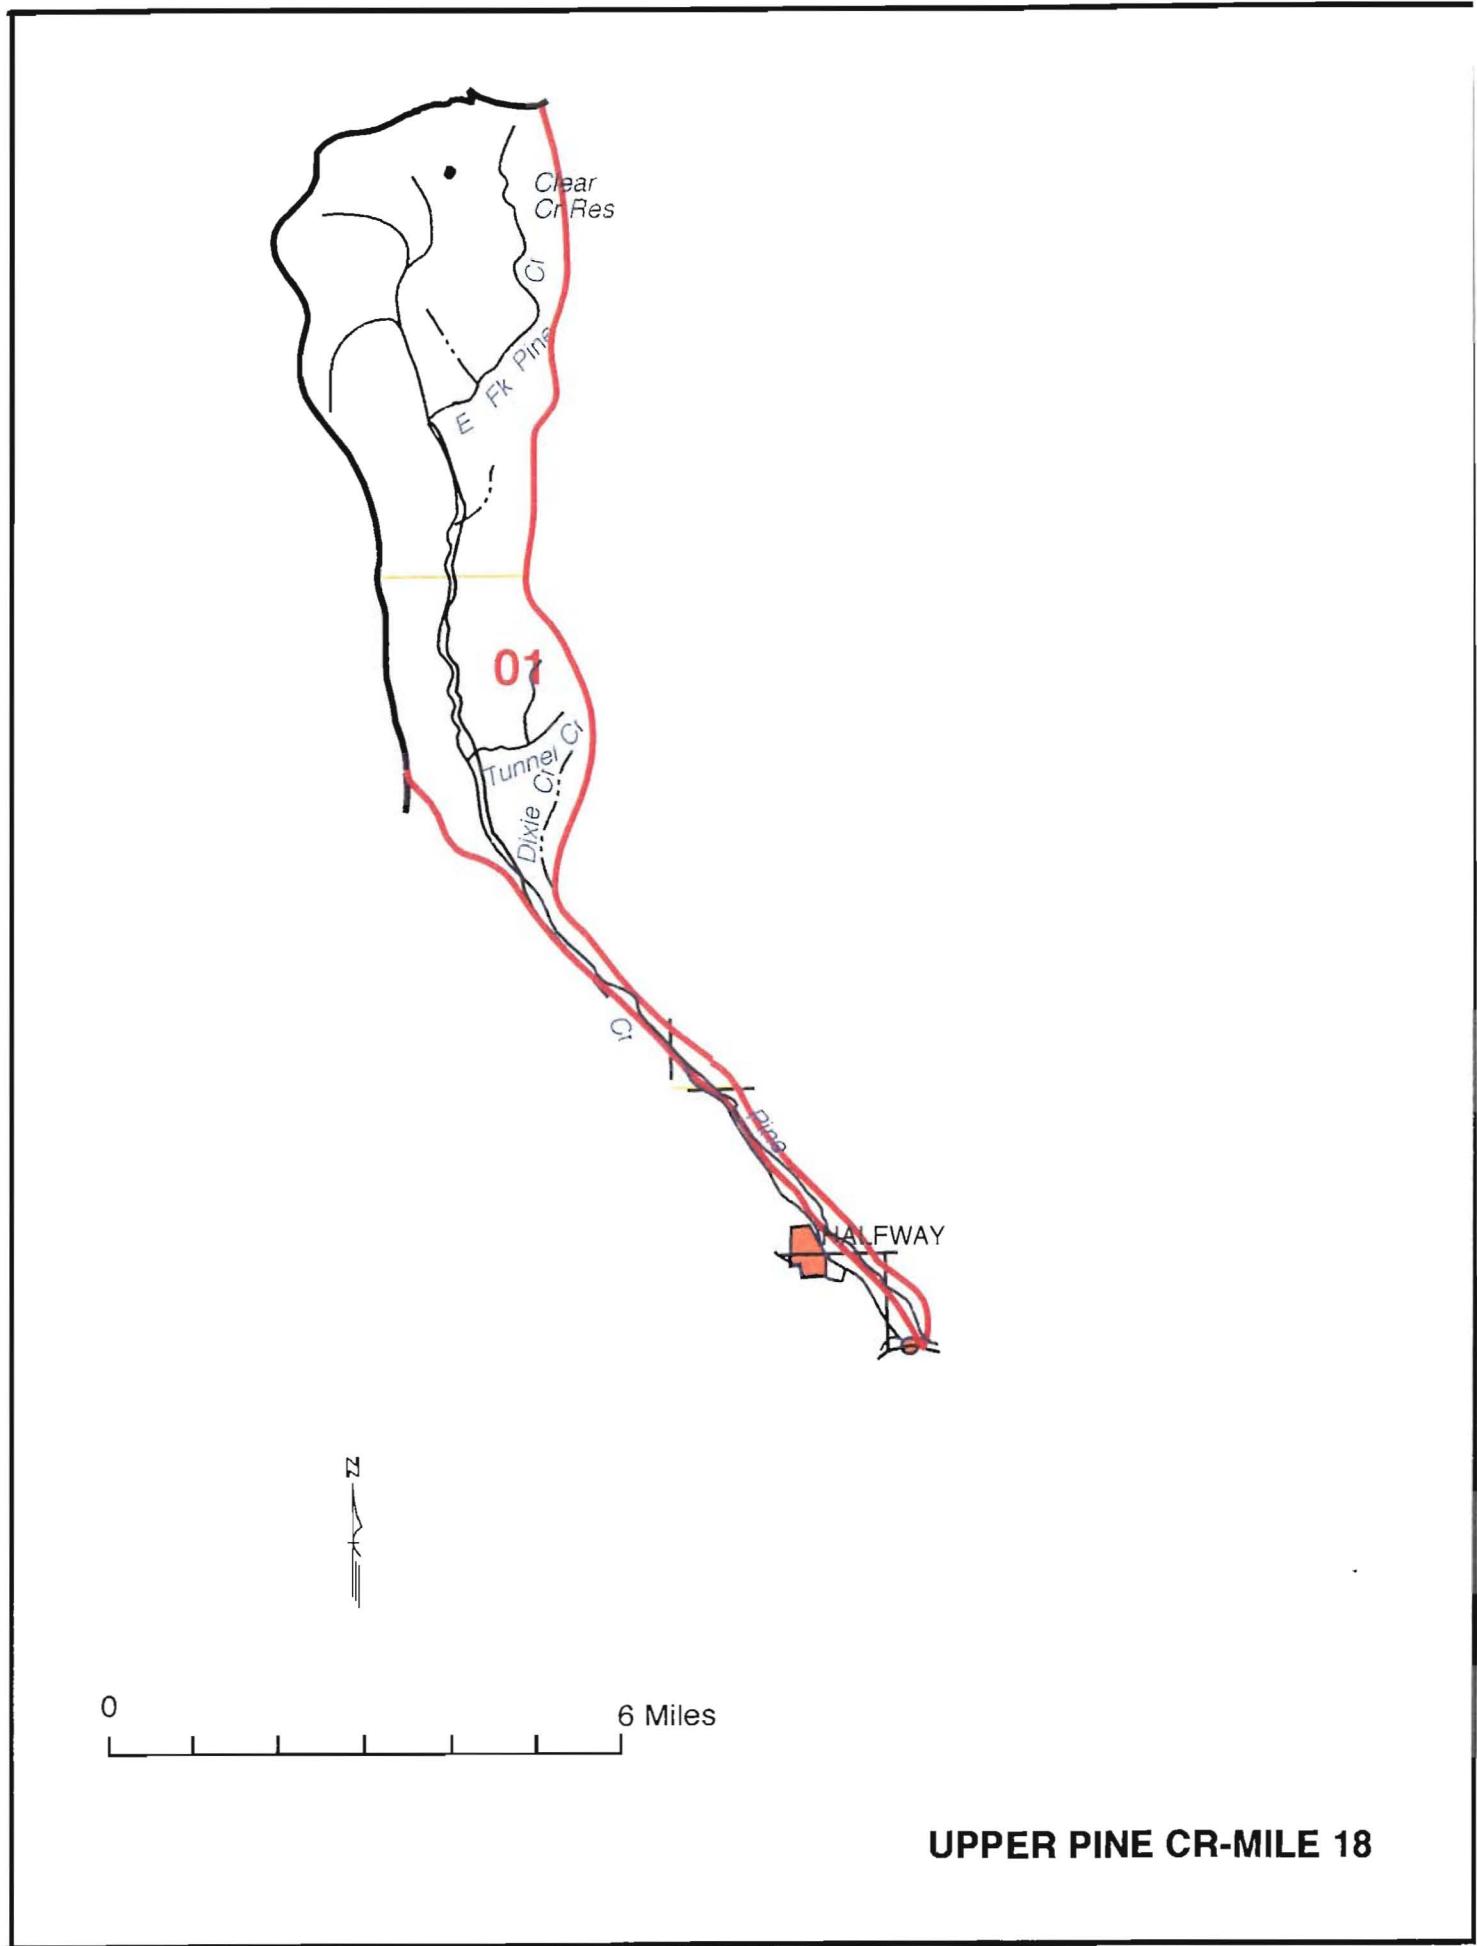

- Lack of Basin Assessment (to include the lack of water quality monitoring)

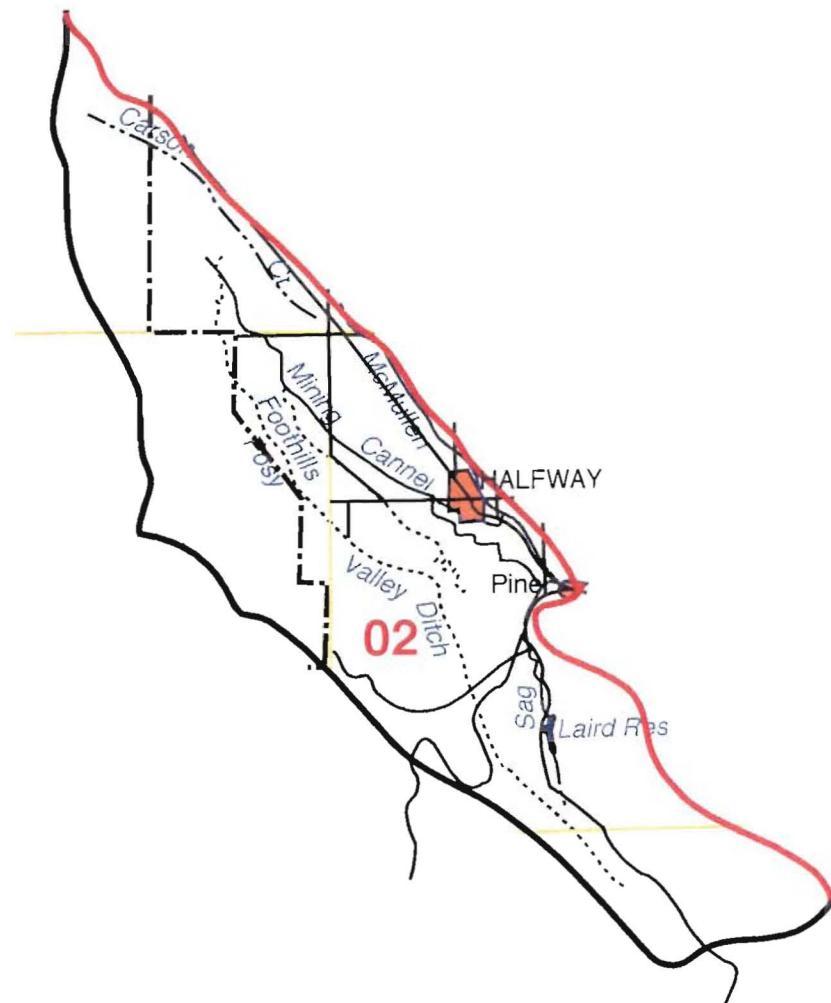

*The Council wants to ensure that (1) the community is educated, supportive, enrolled and enthusiastic about results accomplished and (2) wants the public perception to be that the community has benefited from having healthy watersheds.*
